Centrifugal Fans

with forward curved impellers

Serving North America with the highest quality MOTORIZED IMPELLERS, FANS and BLOWERS

We are proud to be a part of the ROSENBERG family of companies:

Rosenberg Ventilatoren GmbH (Kunzelsau, Germany)

ECOFIT / ETRI S.A. (Vendome, France)

Our family of companies is supported by over 1.400 employees with state-of-the art R&D and manufacturing throughout the world. Rosenberg USA, with offices and warehouse in Indian Trail, NC, is uniquely qualified to service all your air handling applications:

- Technical Expertise & Application Engineering
- Outstanding Customer Service
- Design Flexibility & Custom Fan/Motor Equipment
- Stock Fans for Immediate Shipment
- Full Line of Accessory Products & Controls
- Value Added Manufacturing & Fabrication

ROSENBERG - ECOFIT - ETRI - THE AIR MOVEMENT GROUP

Characteristics and Construction

The high efficient centrifugal fans have been specially developed for modern ventilation and air conditioning applications and are ideal for the movement of air and non-aggressive gas and vapours.

They are mainly used in air handling units, hygienic units, clean room filter units.
They find further application in the cooling of electrical motors and generators (e.g. in wind parks), ventilation of switch cabinets, air conditioning (e.g. in trains).

A high power density with a very compact design is provided by the combination of forward curved wheel and external rotor motor.

The following design models are available:

- ERAE/D: single inlet centrifugal fan
- DRAE/D: double inlet centrifugal fan

ERAE/D

Presentation

The range presented in this catalogue consists of single inlet centrifugal impellers (TRE), single inlet centrifugal fans in steel scroll (GRE - GRF) and double inlet centrifugal fans (GDS - GDF).
In response to your specific needs, the airflow, power, rotational speeds (multispeed by windings or by controllers), noise level, overall dimensions and finish... of the fans can be specifically defined according to your requirements. Try out and appreciate our responsiveness . Consult us right from the beginning of your design.

TRE / GRE / GRF

TRE

GRE

GDS / GDF

GDS

Casings

The casings of the high efficiency centrifugal fans are made of galvanized sheet metal. The side parts are produced with nut sets to fix the mounting brackets, which can be fixed in steps of 90°.
Epoxy coating on request.

ECOFIT series : steel painted black or plastic scroll.

Impellers

The impellers with 38-42 forward curved blades are made of galvanized sheet metal. They are mounted directly to the external rotor motor.

ECOFIT series : galvanised steel or plastic impeller.

The impellers are statically and dynamically balanced together with the external rotor motor according to quality level G2,5 DIN ISO 1940.

Direction of rotation

Direction of rotation for fan types ERA is clockwise viewed from the inlet side, but for fan types DRA it is anti- clockwise viewed from the cable outlet
Caution: Low air volume at wrong direction of spin!

ECOFIT series : direction of rotation is indicated in the catalogue on each datasheet.

Motors

Rosenberg external rotor motors are manufactured in protection class IP54.
ECOFIT external rotor motors are manufactured in protection class IP44 or IP54 for GDF.
The winding insulation corresponds to insulation Class F (UL - approved).
Bearings are deep groove ball type in sealed housing. Special grease lubrication provides maintenance-free operation, low-noise and extended life.

ECOFIT series : ball bearings closed on both sides are used. Special grease lubrication provides maintenance-free operation, low-noise and extended life.

Motor protection

All motors are equipped with thermal contacts, wired in series. Thermal contacts are temperature dependent control elements, sensing the winding temperature of the motor. These contacts protect the motor windings from overload, failure of a mains phase, standstill of the motor and of high temperature rise to the medium ventilated.
In addition to the mounted thermal contacts we recommend the use of our motor protection control units.
Rosenberg also offers 5-step speed controllers, RTE and RTD.
Motors are equipped with the motor protection in connection with thermal contacts. An additional motor protection switch is not required.

Electrical connection

The nominal voltage given on the nameplate provides maximum allowable voltage tolerance of ± 10%. Flying leads are standard.
The connection ends are 10 cm (4 inches) dismantled and equipped with end splices.
Standard cable length is 68 cm (27 inches)
Special cable lengths are available on request.
ECOFIT motors : refer to drawings.

Voltages types

For single phase operation, motors are available for 115V, 208/230V and 277V.
All 230V motors could also be used at 1~230V, 50Hz.
For three phase operation, motors are available for 208V / 230VD // 460V Y.
575V and other special voltages are available on request.

Please reference 60Hz-curves:
- Standard three phase motor can be used at 460V (Star connection) **and** 230V (Delta connection). In Delta connection the motors are also suitable for 208V 3~ power supplies).
- The performance curves show that the 230VD performance is a little less than the 460VY performance.
The standard three phase motors could also be used at 400V Y, 50Hz.

ECOFIT series : for single phase operation, motors are available for 115V, 60Hz. Most of them are usable on 50Hz (refer to drawings).

Speed control

Speed control can be provided for fans that demand optimal adjustment of the operation point. Speed control is obtained by “Voltage Control” and “Frequency Control”, as described below.

Voltage control
The speed control is provided by reduction of the terminal voltage. If the voltage will be reduced the speed of the motor decreases and the air volume flow sinks in proportion with the speed. The matching voltage controllers can be provided on request.

Frequency control
All voltage controllable fans for three-phase power supplies can also be speed controlled by frequency converter from 60Hz downwards. The speed control is realized by reduction of the power supply frequency. At higher frequencies than 60Hz the motor will be thermally overloaded.

With operation of the motors on a frequency controller the maximum speed of voltage increase of 500V /μs must not be exceeded. According to the frequency converter type and the length of the cable between motor and frequency converter additional components must be planned. Please refer to the operation manual of the frequency converter.

Protection against accidental contact

The fans are constructed for installation within applications. We do not include guards of any kind as a part of our standard product offering. Please contact your Rosenberg representative for accessory information.
Before initial operation all required protection components must be installed and connected. Adherence to all electrical and safety codes, including National Electric Codes (NEC), National Fire Protection Association (NFPA) standards and Occupational Safety and Health Act (OSHA) should be followed and are responsibility of the customer. All electrical connections should be performed only by qualified personnel.

Information on safety of machinery

Rosenberg radial fans are usable machines according to the EC Council Directive on Machinery. They are marked with a CE label and delivered with a declaration of conformity.
The dangers of the fan as well as necessary technical measures of safety are judged according to the VDMA standard sheet number 24167: Fans, demands of safety.
The operation manual contains additional measures of safety to be realized on site to make the fan match the EC Council Directive on Machinery 98/37/EC.

Advantages of Rosenberg high efficient centrifugal fans:

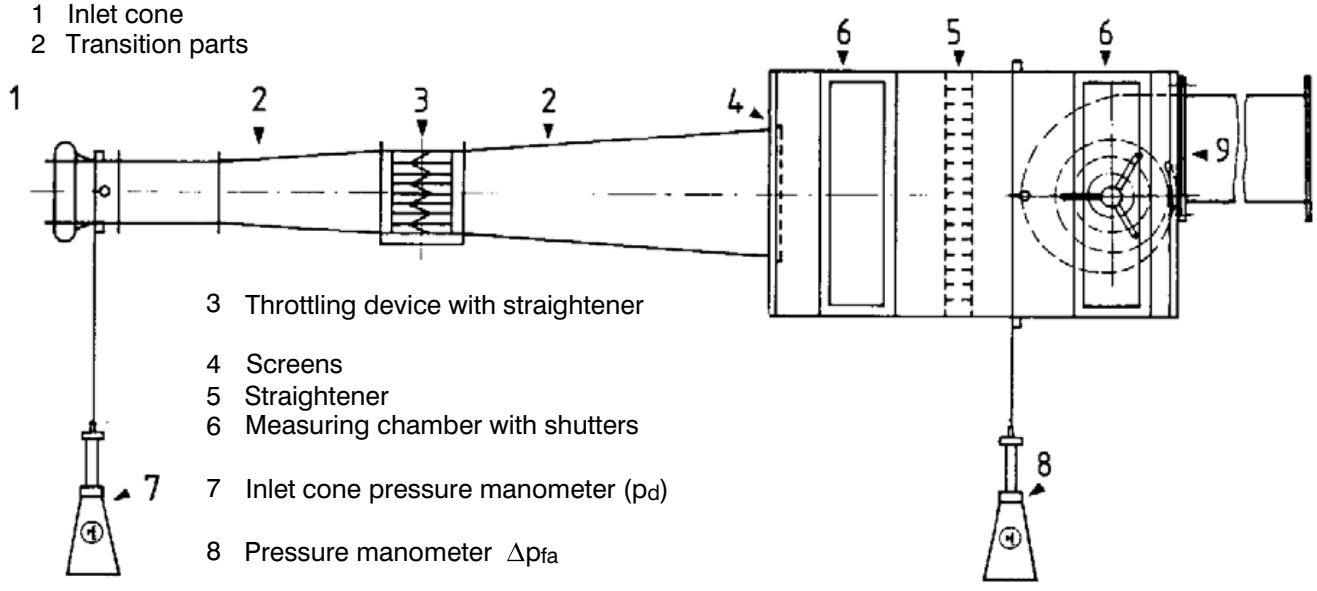

- Compact and space saving design with external rotor motor drive and high performance forward curved impeller
- Low for maintenance direct drive fans (no belt wear or belt replacement necessary)
- Various control possibilities
- Customers requirements can be met without problems
- Easy installation in any position
- Extremely low starting currents
- Motor protection through thermal contacts in motor winding

Air Performance Curves

The air performance curves have been established using the inlet test method in the test chamber as shown below according to German standard DIN 24163. They are valid for air with a density of 0.075#/ft³ with a temperature of 68°F. The performance curves were made in mounting position A (free inlet, free outlet) and show the pressure increase, available on inlet side, p_{fa} as a function of the volume.

Test chamber

1 Inlet cone
2 Transition parts

3 Throttling device with straightener

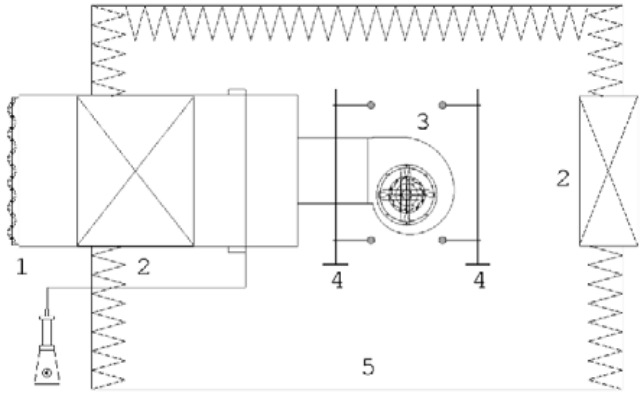

4 Screens
5 Straightener
6 Measuring chamber with shutters

7 Inlet cone pressure manometer (p_d)

8 Pressure manometer Δp_{fa}

Noise levels

The tests and their performance curves were made according to DIN 45635, part 38, according to the envelope surface method, after collection several test points by a cube shaped test area.

1 shutter door
2 sound attenuator
3 test sample
4 measurement arrangement
5 acoustic measuring room with reflecting floor

The characteristic diagram shows the "A" decibel Sound Power level $L_{W(A)}$,. This corresponds to the free-outlet sound power level $L_{W(A)6}$.

The free inlet sound power level $L_{W(A)5}$ can be obtained by the relative sound power level or according to following calculation:

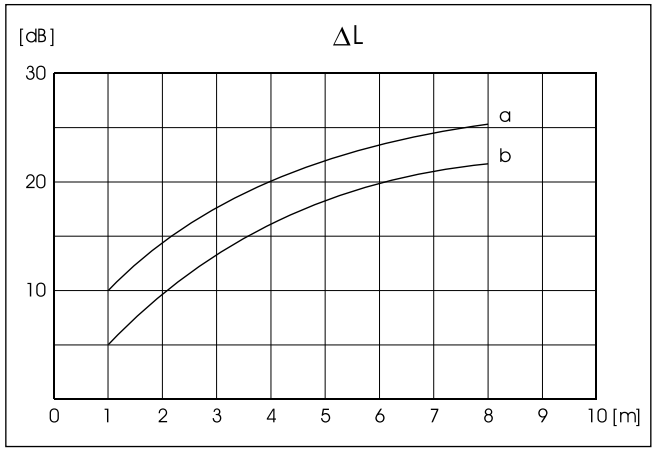

$L_{W(A)5} = L_{W(A)} - 3$ dB(A)

For the exact determination of the sound protection measures the sound power level of the octave bands are important.

$L_{Woct} = L_{W(A)} + L_{wrel}$

DRAE ; DRAD	$L_{WA_{rel}}$ A-weighted at V = 0,5 * V_{max}							
fM [Hz]	125	250	500	1000	2000	4000	8000	Hz
Outlet side 4-pole	-21	-13	-8	-4	-7	-8	-15	dB
Inlet side 4-pole	-18	-13	-10	-5	-4	-10	-16	dB

ERAE ; ERAD	$L_{WA_{rel}}$ A-weighted at V = 0,5 * V_{max}							
fM [Hz]	125	250	500	1000	2000	4000	8000	Hz
Outlet side 4-pole	-23	-10	-8	-4	-7	-9	-16	dB
Inlet side 4-pole	-19	-11	-11	-5	-5	-8	-14	dB

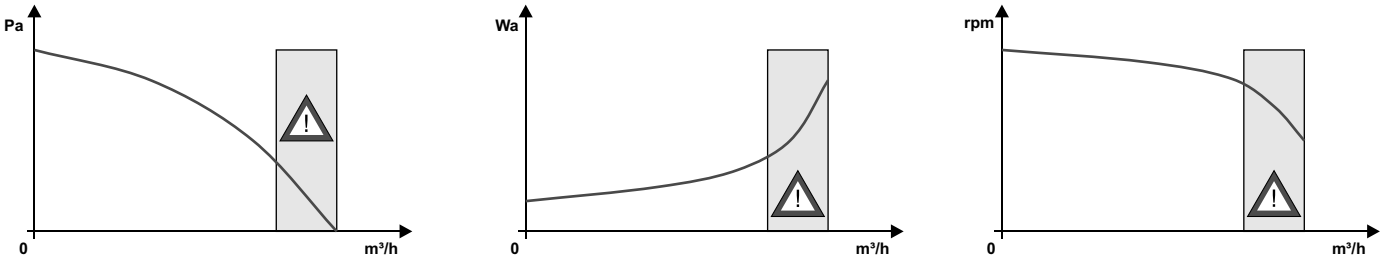

The expected sound pressure level on the outlet side can only be approximately determined as the ambient influences can lead to strong deviations.

$L_{P(A)} = L_{W(A)} - D L$

a= without reflections
b= with reflections

ECOFIT series

Conditions of use

Centrifugal fans with forward-curved impeller blades demand maximum motor power at maximum air flow rate and zero static pressure. Certain fan models have minimum pressure levels below which their motors will over-heat. Performance curves then terminate at minimum permitted pressure.

Impellers with forward-curved blades must be used with the scroll housing and inlet ring recommended by ECOFIT in order to obtain the performance levels declared within this catalogue. Modifications to scroll or inlet will affect fan performance. If the scroll and inlet are part of an appliance, they must be of the same shape and size as the ECOFIT standard, or otherwise approved by ECOFIT.

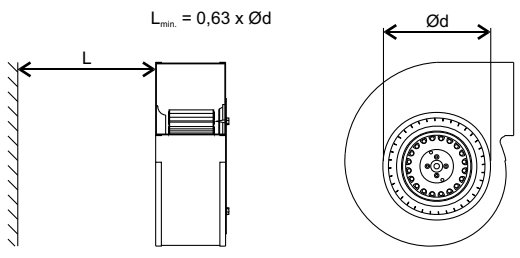

Inlet rings and finger guards are available upon request.

ECOFIT motors are speed controllable by voltage variation, but where electronic controllers are used they must be designed for electric motor duty and be compatible with ECOFIT products.
Capacitors must be of the "motor run" type and be of the recommended value, voltage rating, and life expectancy.
The purchaser must test for motor total temperature in the application, with the worst operating conditions for the motor. ECOFIT should then validate the test results.

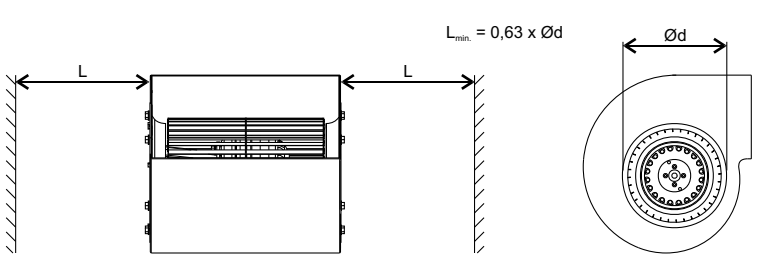

Noise level
The tabulated overall sound levels are to NF S31-026 standard and are expressed as 'A' weighted acoustic pressure, measured one meter from the air inlet.

Life expectancy
The ECOFIT motors and fans described in this catalogue are fifted with ball bearings for use in any mounting attitude. L10 life expectancy is between 30000 and 50000 hours, depending on the application and ambient condition.

TRE / GRE / GRF

GDS / GDF

Performance Curves

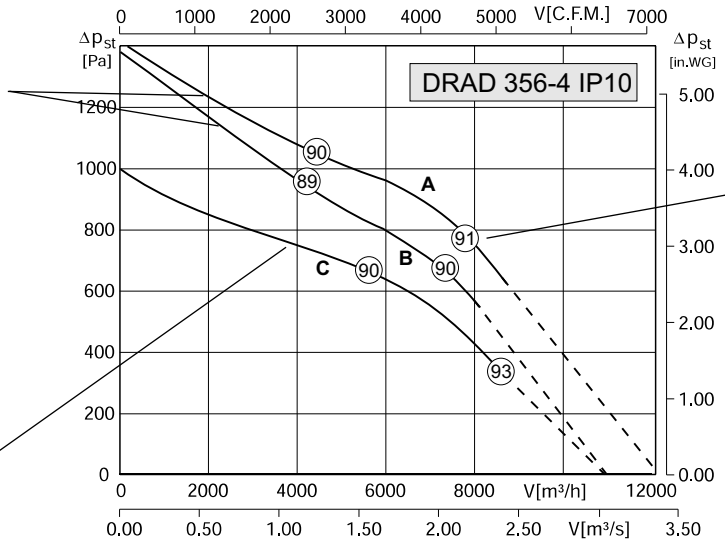

The performance curves indicate the static pressure increase Dpfa as a function of the volume flow. The performance curves refer to an air density of 0.075 kg/ft³.

Fan performance curve at rated voltage 60Hz:

Single phase motors:
Curve A=rated voltage (115 V or 230 V ; depends on motor execution)

Three phase motors:
Curve A=460 V Y-connection
Curve B=230 V D-connection

Fan performance curve at rated voltage 50 Hz

Sound power level

IP protection class

Wiring diagram

Weight

Information:
Every three phase motor can be used at 460 V (Star connection) and 230 V (Delta connection). The performance curves show that the 230VD (curve B) performance is a little less than the 460VY (curve A)performance. In Delta connection the motors are also suitable for 208V 3~ power supplies.

High Efficiency Radial Fans

with compact casing

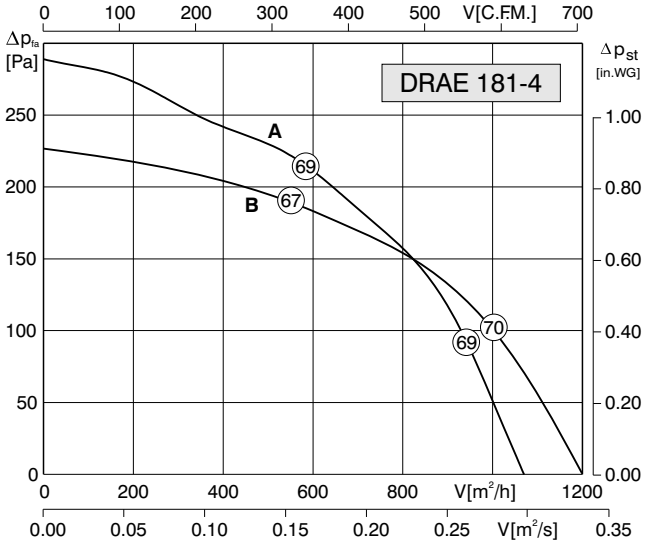

Advantages:

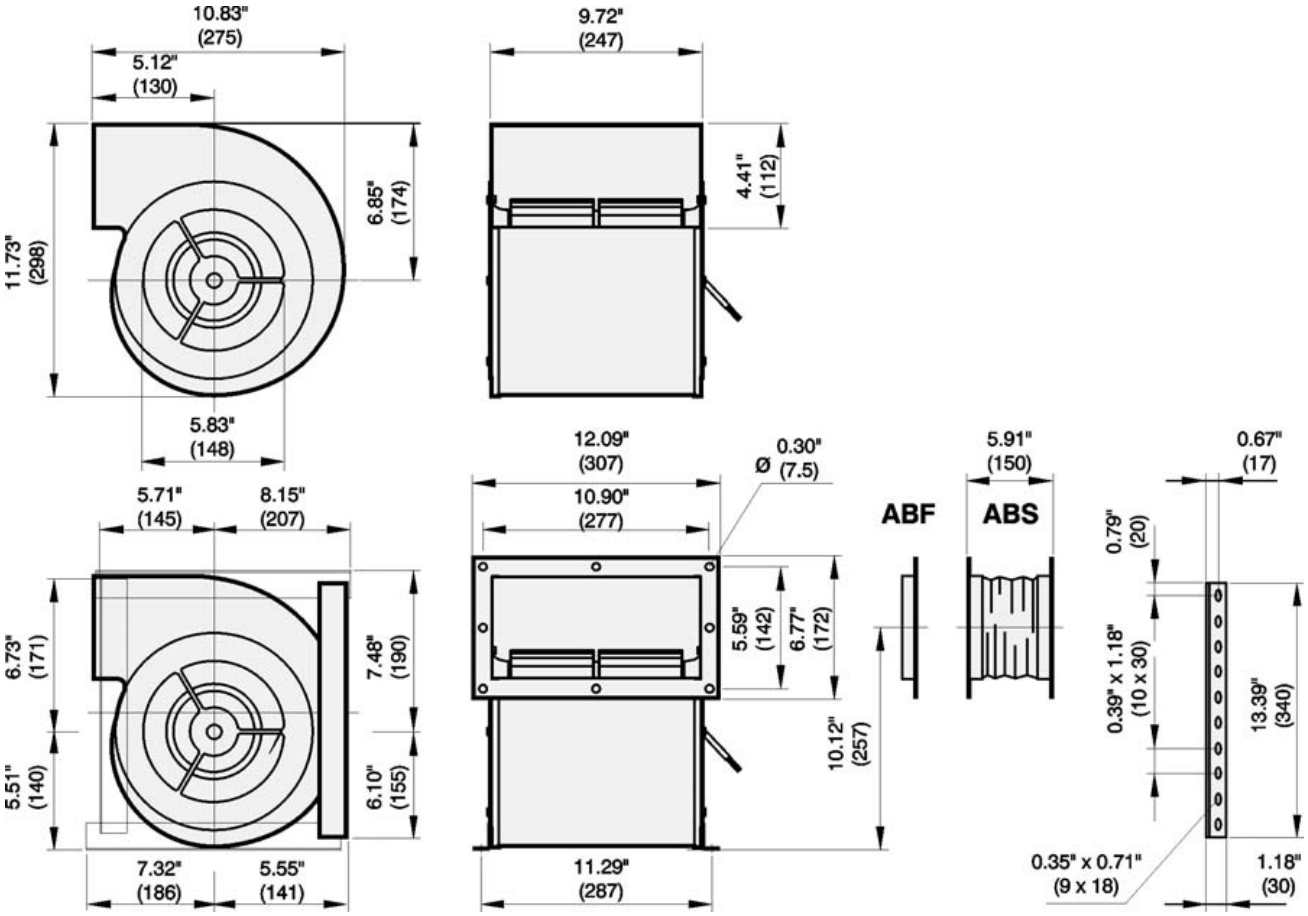

- **Steep pressure-volume-performance curve**
- **The speed is 0-100% adjustable using auto transformers or electronic control**
- **Easy air volume adjustments via a large range of control products based on pressure and temperature**
- **Compact and space saving design**
- **Easy installation in many positions**
- **Extremely low starting currents**
- **Motor protection by thermal contacts in motor windings**

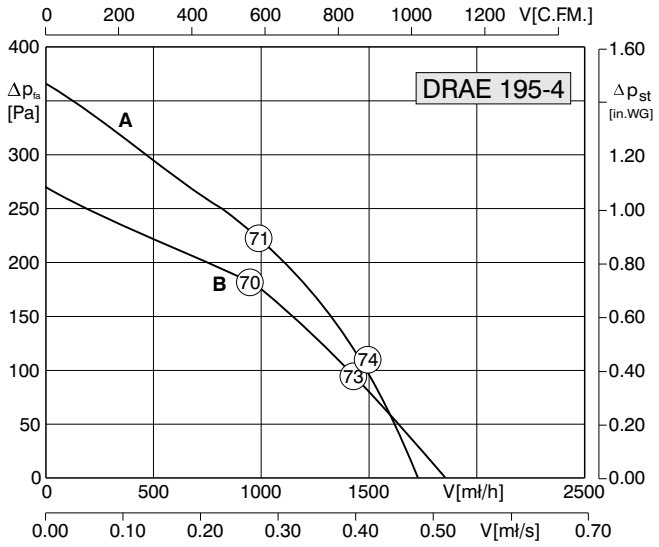

- Steep pressure-volume-performance curve
- compact and space saving design
- 100% speed controllable through auto transformers
- Motor protection through thermal contacts as standard
