# Overview of the SACE ML family 

## Based on the long experience, ABB SACE is proud to offer a new family of circuit breakers for naval application and critical enviroment which sets a new circuit breaker benchmark for the needs of today and

 tomorrow.A modern ship's operational ability is fully dependent on its onboard electrical infrastructure. Over the years, the growth in the number of electrically powered subsystems on a typical naval vessel has made this infrastructure ever more complex and extensive. it has also led to a steady increase in power requirements.
These trends lead to new customer and application needs. To meet these demands, ABB has now unveiled the innovative ML family, the evolution of the ABB circuit breaker into a multifunctional platform that is able to manage the next generation of electrical plants such as microgrids.

For over 50 years, ABB SACE has been building shockproof equipment for navies around the world. The considerable installed base of the company's products on ships of the world's main navies underlines the reliability of ABB SACE electrical equipment. Since the 1950s, the company has been manufacturing circuit breakers with special features not available on the same series of equipment destined for general use.

## Distinctive features

#### Abstract

SACE ML series is the ABB Iow voltage circuit breakers available from 400 A up to 6300 A and with the ability to efficiently and simply control electrical navy installations - from the traditional to the more complex with the highest availability and continuity of service.

The circuit breakers of the ML series have been realized with opportune changes of the standard version with the purpose to guarantee the operations also in presence of critical environmental conditions.
The low-voltage electrical distribution plants inside the modern ship are driven by these following growing needs:

- Ensure service continuity by minimizing the time needed to identify and isolate faults
- Guarantee space optimization
- Optimize energy efficiency maintaining the performance
- Safety and ease of use

## Reliability and service continuity

ABB SACE ML circuit breakers are the most advanced and complete solution for ensuring service continuity.
With redundant actuators and built in communication modules, ABB ML circuit breakers take electrical system reliability to new levels.

ABB's solution is the only one that uses both a communication bus and electrical connections to prevent, detect and isolate electrical faults. Its unique "digital zone selectivity" function, identifies the fault zone faster and isolate it reducing the stress in the remaining active zone. As a result, the electrical protection is more robust and costly shutdowns are more effectively prevented. Moreover ML series features enhancements to the standard circuit breaker that guarantees operation under stressful conditions:

- Shock resistance up to $\mathbf{2 0 g}$ ( IEC 60068-2-27)
- High temperatures and humidity range in a saline atmosphere; ML circuit breakers can be used in ambient conditions where air temperature varies between $-25^{\circ} \mathrm{C}$ and $+70^{\circ} \mathrm{C}\left(-13^{\circ} \mathrm{F}\right.$ and $+158^{\circ} \mathrm{F}$ )
- Presence of vibrations that are persistent and have a high amplitude in specific frequency ranges

## Dimension and weight optimization

SACE ML series offers maximum protection, best efficiency and it is the ABB low voltage circuit breakers available from 400 A up to 6300 A. The different levels of rated nominal current and breaking capacity levels have been studied to ensure optimal sizing for all ships' configurations. SACE Emax 2 /ML is the most compact circuit breaker on the market, which makes it possible to reduce the size of switchboards up to $30 \%$. SACE Emax 2 /ML offers the highest performances in the smallest space. Less space is required in the switchgear and in the metal structures. The result is less oversizing, lower weight and, therefore, higher saving related to space optimization SACE ML series makes it possible to standardize the circuit breaker support structures, considerably simplifying construction of the switchboards themselves. All trip units are easily interchangeable and all communication units can be installed directly on the terminal box with a few simple operations, making the complex system ready for a new digital experience.

## Performance

Next-generation ships will use more advanced microgrid technologies to overcome current power distribution challenges. Electrical distribution on a ship is an islanded microgrid, connecting multiple power generators and energy storage systems, that manages directional power flows. By using smart technologies to protect, connect and control the electrical system, ships can operate more efficiently and productively.
ML low-voltage circuit breaker is the industry's first smart circuit breaker. Its embedded connectivity and load management software provides a comprehensive energy management solution. The load profile optimization functions of ML circuit breaker reduce CO2 emissions and fuel costs. The innovative circuit breaker safeguards a ship's mission- critical loads and generators, using advanced adaptive protection to maximize productivity under all conditions.

## Safety and ease of use

The ML range is available in fixed and withdrawable versions, with double insulation between the front of the switchgear and the live parts to ensure operation in complete safety. All essential information is available in front shield and enables immediate identification of the status of the circuit breaker: open, closed, ready to close, charged and discharged springs. Maintenance is simple and safe. Thanks to the new front shield design, the main accessories can be installed without completely removing it. As a further guarantee of safety, the shutters of the fixed part can be locked from the front when the circuit breaker mobile part is removed. The shutters of the upper terminals are independent of those of the lower terminals to facilitate checking and maintenance operations.
The protection trip units are equipped with a large display which enables safe and intuitive operation. Furthermore the trip units can be programmed and consulted from a tablet, smart phone or portable PC via the Ekip Connect application some the advanced functionalities can be easily programmed thanks to predefined logic templates.

## Product conformity

## Quality, Sustainability and Customer Satisfaction have always been ABB's major commitment.

## Resistance to shock and vibration

The ML circuit breakers are unaffected by vibrations generated mechanically or due to electromagnetic effects, in compliance with the IEC 60068-2-6 Standards and the RINA MIL regulations. Moreover ML circuit breaker are compliant with the following International SHOCK standard: - IEC 60068-2-27 ( $20 \mathrm{~g}-11 \mathrm{~ms}$ )

## Approvals and certifications

ABB ML circuit breakers and their accessories conform to the international IEC 60947, EN 60947 (harmonized in 30 CENELEC countries), CEI EN 60947 and IEC 61000 Standards and comply with the following EC directives:

- "Low Voltage Directives" (LVD) no. 2006/95/EC
- "Electromagnetic Compatibility Directive" (EMC) no. 2004/108/EC.

Certification of conformity with the above-mentioned product Standards is carried out in compliance with the European EN 45011 Standard, by the Italian certification body ACAE (Association for the Certification of Electrical Equipment), which is recognized by the European organization LOVAG (Low Voltage Agreement Group), and by the Swedish Intertek SEMKO certification organization Intertek Semko which is recognized by the international organization IECEE.

## Product conformity

The involvement of all company departments and organization of processes have led the company to develop, implement and certify management systems in compliance with international Standards:

- ISO 9001 for quality management
- IRIS for the quality of supplies in the railway sector (International Railway Industry Standards)
- ISO 14001 for environmental management
- OHSAS 18001 for the management of the health and safety of employees in the workplace
- SA 8000 for the management of social responsibility.

## The ABB SACE testing laboratory, accredited by ACCREDIA in

 compliance with ISO/IEC 17025 Standard, provides both ABB and external customers with a qualified service for performing certification tests on devices and electric equipment of low and medium voltage in accordance with the relevant product Standards.Thanks to the implementation of systems and their integration (Integrated Management System), ABB SACE, with a view to continuous improvement, has implemented processes with a focus on:

- quality, preventing defects and faults along the entire supply chain
- environment, reviewing production processes in terms of ecology and waste reduction, rationalizing the consumption of raw materials and energy, preventing pollution, containing noise emissions and reducing the quantity of rejects in the production processes
- health and safety of employees, offering a healthy and safe workplace in all of the various stages of work with a "zero accident objective"
- social responsibility, guaranteeing the respect of human rights and the absence of any discrimination throughout the supply chain, and offering a favourable and transparent working atmosphere.
A further commitment aimed at safeguarding the environment has been achieved by assessing products' life cycles (LCA, Life Cycle Assessment): this includes the assessment and improvement of the environmental performance of products from the engineering stage throughout their entire life cycle. The materials, processes and packaging used are chosen with a view to optimising the actual environmental impact of each product, including its energy efficiency and recyclability.

## Trip units

18-19 Protection trip units
20-21 Ekip Touch
22-31 Protection functions

## Protection trip units

# SACE ML trip units are the new benchmark for the protection, measurement and control of low voltage electrical systems. The result of ABB SACE's experience and research, they make ML circuit-breaker, embedding advanced functionalities, to become an all-in-one solution for as well distribution systems and microgrid. 

The protection units are divided into different families which can be suitable for distribution protection and for generator protection. The range of trip units is available with many levels of performance to satisfy simple to advanced applications.
Thanks to their simplicity of assembly, the end customer can change the type of trip unit extremely rapidly, according to their own requirements and needs. This means an increased flexibility of use of the circuit-breakers with considerable savings in terms of costs thanks to better rationalisation of stock management. The complete, flexible protection trip unit offering, which can be adapted to the actual level of protection required, is shown in the following pages.

SACE Emax 2 Ekip protection trip units are the new benchmark for the protection, measurement and control of low voltage electrical systems. The protection units, available in the LSI and LSIG versions, are divided into two families: Ekip for distribution protection and Ekip G for generator protection.

The Ekip trip units are designed to protect a vast range of applications, such as use with transformers, motors and drives. Ekip Dip, Ekip Touch or Ekip Hi-Touch can be selected, depending on the complexity of the system, the need to take voltage or energy measurements or to include control systems in switchgear.
Ekip $G$ enables the protection of generators without the use of external devices that require dedicated relays and wiring. Ekip G increases efficiency from the design stage to installation, minimizing the time needed for realization and commissioning of the system, and ensuring high levels of accuracy and reliability of all protection devices required for running generators in applications such as naval, GenSet or cogeneration. Thanks to the Network Analyzer function integrated in all Hi-Touch versions, the quality of energy in terms of harmonics, micro-interruptions or voltage dips is monitored without the need for dedicated instrumentation. This allows effective preventive and corrective action to be implemented through accurate analysis of the faults, thereby improving the efficiency of the system Here below there is a summary of the trip units portfolio for Emax 2 ML circuit breaker.

# All ML circuit-breakers are equipped with protection trip units that are interchangeable from the front with just a few, simple operations by the customer. 

This enables personalization of the functions available, even during commissioning or when the circuit-breaker has already been installed. In particular, consists of:

- Protection trip unit, available with different interfaces and versions that range from basic to more complete; it contains a latest generation microprocessor that performs all the functions of protection and control.
- Interchangeable rating plug enables all protection thresholds to be adjusted according to the rated current, increasing flexibility for the customer. It is useful in installations that are prepared for future development or in cases in which the power supplied may be limited temporarily.
- Main board is the mechanical housing of the trip unit, which includes a micro-controller for measuring currents and the self-protection functions. The separation of trip units ensures excellent reliability and immunity to conducted and radiated emissions. Integrated new generation Rogowski sensors, which are sensitive to the true r.m.s. value of the current, guarantee high accuracy of both measurements and protection.

## Ekip Touch

Ekip Touch is the new protection trip unit for SACE Emax 2 that provides a complete series of protections and high accuracy measurements of all electric parameters and can be integrated perfectly with the most common automation and supervision systems.

The simple and intuitive interface enables the operator to access all the information and settings rapidly and easily by minimizing installation and commissioning time.

For more info about the trip unit functionalities please check the Emax 2 catalogue.

Key:

1. Wide high-resolution colour touchscreen display
2. Power-on LED to indicate correct operation (watchdog) Pre-alarm LED
3. Alarm LED
4. Home pushbutton to return to home page
5. Pushbutton for test and indicating cause of trip 7. Test and programming connector

|  |  | Tolerance | $\pm 10 \%$ |  |  |  |

(1) With Vaux all thresholds are available. Without Vaux minimum threshold is limited to: $0.3 \ln$ (with $\ln =100 \mathrm{~A}$ ), 0.25 In (with $\operatorname{In}=400 \mathrm{~A}$ ) or $0.2 \ln$ (for all other ratings)

The tolerances above apply to trip units already powered by the main circuit with current flowing in at least two-phases or an auxiliary power supply.
In all other cases the following tollerance values apply:

| ABB Code | Trip threshold | Trip time |
| :--- | :--- | :--- |
| $\mathbf{L}$ | Trip between 1.05 and $1.2 \times \mathrm{II}$ | $\pm 20 \%$ |
| $\mathbf{S}$ | $\pm 10 \%$ | $\pm 20 \%$ |
| $\mathbf{l}$ | $\pm 15 \%$ | $\leq 60 \mathrm{~ms}$ |
| $\mathbf{G}$ | $\pm 15 \%$ | $\pm 20 \%$ |
| Other protection | $\pm 15 \%$ | $\pm 20 \%$ |

Ekip G generator protection trip unit
Logic zone selectivity for Emax 2/ML
Load shedding

## Advanced features

#### Abstract

A modern ship's operational ability is fully dependent on its onboard electrical infrastructure. Over the years, the growth in the number of electrically powered subsystems on a typical naval vessel has made this infrastructure ever more complex and extensive, and has led to a steady increase in power requirements.

ABB provides the first smart circuit-breaker that combine advanced protection, programmable logic, full connectivity, and comprehensive energy management in all-in-one revolutionary device. ML circuit breaker integrates the functions of Interface Protection System and Interface Device in order to check the Main Grid conditions and disconnect the User's plant whenever grid voltage and frequency are out of the ranges prescribed by the connection standard.
ML circuit breaker and its adaptive protections recognize the network change and automatically set new thresholds to guarantee protection and coordination in on-grid and off-grid conditions. Emax 2/ML is more than a circuit breaker as traditionally defined, compactness and high reliability from pre-tested functions makes Emax 2/ML highly suitable for applications in ships and marine vessels.

Emax 2/ML is an all-in-one innovative concept, in fact it is the first intelligent circuit breaker designed to protect, connect and optimize low-voltage microgrid applications. Accessories (modules) are added to the breaker to achieve all the additional functions needed.
Besides the advanced functionalities described on the following page, Emax 2 integrates in a single device the following function:

## Synchro reclosing,

Automatic Transfer Switch, Watchdog.

For further detail please refer to your local ABB referent.

# Ekip G generator protection trip unit 

#### Abstract

ABB SACE ML family, with the new Ekip G generator protection trip unit, offers an effective and reliable solution designed for the protection of low voltage generators.

Ekip $G$ is the new generator protection release, which has all the protection embedded and it can monitor all the key critical parameters for connecting the generator to the system. These functions, generally provided by multifunction independent relays, are now integrated into SACE ML circuit breaker to guarantee a solution that is easy to install, compact, and reliable.
The generator is one of the most delicate part of the ship's electrical system. The protections, especially those that safeguard this machine from the most heavy failures, are often redundant. Hence the protection system for a generator is complex and complicated to be calibrated and to be managed. The protections available on Ekip G are individually activated and cover a wide spectrum of onboard electrical system. They also comply with the major international regulations and standard that provide guidance on the type of protections to be used to control generators, for example in the naval field.

Ekip G is compliant with the standard IEC 60034-1 "Rotating electrical machines - Part 1: Rating and performance" of with the IEEE C37.102 "Guide for AC Generator Protection" and IEEE 242 "Protection and Coordination of Industrial and Commercial Power Systems" or requirements requested by naval standard such RINA, DNV etc.
Nevertheless, the most commonly required protections according also to the indications given in the above mentioned Standards and rules are summarized in the Table below.

| Protections for synchronous generators | SnG < 500kVA | 500kVA < SnG < 1500kVA | SnG > 1500kVA |
| :---: | :---: | :---: | :---: |
| Protections against loss of prime mover: |  |  |  |
| - Active power directional protection | - | - | - |
| Protections against overloads: |  |  |  |
| - Overload and overcurrent | - | - | - |
| - Current unbalance | - | - | - |
| Protections against failures of the excitation system: |  |  |  |
| - Loss of field | - | - | - |
| - Under/Overvoltage | - | - | - |
| Protections against frequency variations: |  |  |  |
| - Under/Overfrequency | $\bullet$ | - | - |
| Protection against network loss: |  |  |  |
| - Rate of change of frequency | - | $\bullet$ | - |
| Protection against failures of the insulation system: |  |  |  |
| - Stator earth fault | $\bullet$ | $\bullet$ | $\bullet$ |

The Ekip G trip unit is able to:

- monitor the frequency and voltage inside the machine whereby tripping the machine main circuit breaker would isolate the generator from the rest of the plant without eliminating the fault;
- monitor the interaction conditions between the generator and the rest of the plant and provide for the separation and protection of the two systems when the conditions for interconnection are missing.
In both cases, programmable contacts are available that can be used to determine the shutdown
 of the generator, of the prime mover and of excitation. Ekip G, which is supplied as standard with Ekip Measuring Pro module, is comprised of current, frequency, voltage and power protection functions specific for generators.
The main features available are summarized in the table below.

| Function | Description | ANSI | ABB |
| :---: | :---: | :---: | :---: |
| Synchrocheck | Control of adequate conditions for parallel connection | 25 | SC |
| Active overpower protection | Protection against active overpower supply | 320F | OP |
| Reactive overpower protection | Protection against reactive overpower supply | 320F | OQ |
| Reverse active power protection | Protection against active power absorption (reverse power) | 32R | RP |
| Directional overcurrent protection | Protection against directional current | 67 | D |
| Active underpower protection | Protection against active underpower supply | 32LF | UP |
| Loss of field or reverse reactive power protection | Protection against energizing anomalies, check of reactive power absorption | 40/32R | RQ |
| Overload protection | Current protection against temperature rise | 49 | L |
| Instantaneous overcurrent protection | Instantaneous protection against phase overcurrents | 50 | I |
| Time-delayed overcurrent protection | Inverse/definite time protection against phase overcurrents | 51 50TD | S |
| Earth fault protection | Inverse/definite and instantaneous time protection against earth overcurrents | 51N 50NTD 50N; 51G 50GTD | G; Gext |
| Differential ground fault protection | Definite time protection against earth overcurrents in the generator windings | 87N | Rc |
| Voltage controlled overcurrent protection | Protection against short circuit between phases with current threshold depending on voltage (controlled/restrained mode) | 51V | S(V) |
| Residual overvoltage protection | Protection detecting loss of insulation in the machine | 59N | RV |
| Undervoltage protection | Protection against voltage decrease | 27 | UV |
| Overvoltage protection | Protection against voltage increase | 59 | OV |
| Current unbalance protection | Protection against phase current unbalance | 46 | IU |
| Voltage unbalance protection | Protection against voltage unbalance and detection of rotation direction of phases | 47 | VU |
| Rate of change of frequency protection | Protection against rapid frequency variations | 81R | Rocof |
| Overfrequency protection | Protection against frequency increase | 81H | OF |
| Underfrequency protection | Protection against frequency reduction | 81L | UF |

# Logic zone selectivity for Emax 2/ML 

Emax 2/ML can manage the logic zone selectivity using the reliability, flexibility and efficiency of Ekip link, the ABB proprietary communication bus.

A major element of vessel power system design is protection against electrical faults. One very efficient method of handling faults is logic zone selectivity (or "discrimination"), which allows rapid fault isolation without users, other than those directly affected, seeing any effect. This approach can accurately isolate the fault branch by quickly opening the adjacent circuit breaker(s) and reduce the transitory on fault time and the electrical stresses.
Logic zone selectivity combines zone selectivity and directional protection. In contrast with traditional selectivity methods, which are based on time and/or current, the principle of logic zone selectivity is that the breaker that should trip for a fault sends a blocking signal to other breakers (upstreams) to prevent them from tripping. The principally impacted breaker can block other breakers from tripping, when appropriate. With Emax2, locking signal can be realized by traditional hardwire or by bus communication using Ekip Link.

Behind this scheme lies a logic that defines which breakers should and should not be tripped in certain situations. This logic is managed by Ekip Connect, the ABB software for the configuration of the electronic trip units.
Ekip Link, the ABB communication module for low voltage circuit breaker, communicate between circuit breaker using an internal ABB proprietary bus. The use of a proprietary bus guarantees very fast and predictable communication (independent of traffic on other buses)

Using ABB communication protocol, Ekip Link can:

- Create complex logic selectivity without using complex wiring
- Provide redundancy, using both Ekip link bus and standard wiring
- Provide diagnostics (configurable) to test the wiring selectivity
ABB's Emax 2 is the first low-voltage circuit breaker with fully integrated directional protection and zone directional selectivity functions. using directional protection, there is also a possibility to set different delay times for the different directions.
Emax 2 air circuit breaker equipped with Ekip Link form the basis of a unique solution for low-voltage logical zone discrimination that has been designed to meet the most demanding requirements of reliability, flexibility and efficiency in
 vessels. This solution is easy to install, commission and test.

# Load shedding 

## Emax 2/ML with embedded Load Shedding innovation creates the new benchmark for the service continuity in the naval electrical system.

ABB Emax 2, the all-in-one smart circuit breaker, embeds patented functions based on load shedding. this innovative algorithms manage the available resources maximizing the efficiency.
Load Shedding functions are adopted to protect Microgrids, as vessels power system, during fault operation.
The load shedding function is able to switch from one source of energy to the other one, this happen when a fails occur in one of the energy source present in the power system. During this switch, the total amount of energy in the system fall down and not all loads can be fed. Load shedding, giving priority to the loads, maintains active only the primary loads while disconnecting the secondary. In this way the main functions are kept active even in case of fault. This advance function for Microgrid can be manage by an automatic transfer switching (ATS) logic. Emax 2/ML can provide two different customization of the load shedding which is mentioned below:

- Basic Load Shedding, simple logic able to recognize the Microgrid disconnection event and shed a group of not priority loads thus ensuring a fast time response and power balance.
- Adaptive Load Shedding, the advanced algorithm available with Emax 2 as an enhancement of the basic version. The intelligent software embedded in the circuit breaker sheds very quickly the not priority loads according to the Microgrid power consumption and frequency measurements.
- Moreover, such software has a dedicated configuration for backup generation related to ATS and the software itself is even able to estimate the energy produced by the back up energy source.
Emax 2/ML with embedded Load Shedding provide the following benefits:
- Service continuity: When a naval system has a problem in one of the main generator, there is a significant stress that turns off all the generators with consequent blackout. Load Shedding logics embedded in Emax 2 reduce the frequency drop that usually makes the local generation protection trip, maintaining the plant live.
- Space saving: Neither PLC neither external relays are needed as Emax 2 has embedded the intelligence to realize the load shedding logics, taking advantage of the internal current and voltage sensors for electrical parameter measurements. Significant space and material saving up to $50 \%$ in the power distribution switchgear for panel builders.
- Ease of use: Load shedding logics are generally set with high engineering skills and customization effort with devices as programmable logic controllers. While Emax 2 guarantees easy installation thanks to predefined templates and the user-friendly graphic interface in the SW commissioning tool.

For further information, please refer to the White Paper "Emax 2, all-in-one innovation - Load Shedding" (1SDC007119G0201).

## Instructions for ordering Ordering examples

The code for molded case circuit breakers includes a fixed list of accessories For further detail please contact ABB.

## Ordering examples

- Ordering for Ekip modules.

Ekip Supply module enables Ekip Com, Ekip Link, Ekip 2K, Ekip Syncrocheck cartridge modules to be installed.

In addition to Ekip Supply modules, up to 3 cartridge modules can be installed on E2.2, E4.2 and E6.2.

Example no. 1
Emax E4.2H 3 poles with modules: Ekip Supply, Ekip Com Modbus TCP, Ekip Signalling 2K-1,
Ekip Com Modbus TCP Redundant and Ekip Signalling 4 K

| 1SDA083492R1 | E4.2H/ML 3200 Ekip Hi-Touch LSI 3p |
| :--- | :--- |
| 1SDA074173R1 | Ekip Supply 24-48V DC E1.2..E6.2 |

| 1SDA074158R1 | Ekip Com R Modbus TCP E1.2..E6.2 |
| 1SDA074167R1 | Ekip Sign. 2K-1 E1.2..E6.2 |
| 1SDA074170R1 | Ekip Sign. 4K E2.2..E6.2 |

Example no. 2
Emax E4.2H 3 poles with modules: Ekip Supply, Ekip Com EtherNet/IPTM, Ekip Com Modbus RS-485 and
Ekip Measuring Pro

| 1SDA083492R1 | E4.2H/ML 3200 Ekip Touch LSI 3p |
| :--- | :--- |
| 1SDA074173R1 | Ekip Supply 24-48V DC E1.2..E6.2 |
| 1SDA074155R1 | Ekip Com EtherNet/IPTM E1.2..E6.2 |
| 1SDA074150R1 | Ekip Com Modbus RS-485 E1.2..E6.2 |
| 1SDA074189R1 | Ekip Measuring Pro E4.2 |

- Ordering for electrical accessories.

All the accessories are available. In particular up to 4 coils for E2.2, E4.2 and E6.2.

## Example no. 3

Emax E2.2S 3 poles with accessories: opening release, closing release, motor for automatic charging of the springs, second opening release
